1.0 Introduction

In an era where the job market is fiercely competitive, the transition from academic institutions to professional careers is a crucial juncture for fresh graduates. GetMe Hired, a pioneering CV generator website, has played a pivotal role in connecting fresh graduates with prospective employers. Recognizing the ever-growing demand for efficient career services, GetMe Hired has emerged as a bridge, facilitating the exchange between job seekers and companies seeking talent. By offering dynamic templates and personalized guidance, the platform has successfully assisted countless graduates in crafting compelling resumes that stand out in the competitive job market.

GetMe Hired has been dedicated to empowering young professionals by providing an innovative CV generator service. However,as the demand for GetMe Hired's services has surged, reflecting a growing reliance on digital solutions for career advancement, the company has encountered challenges in managing the increasing volume of CVs. This challenge is particularly pronounced during peak recruitment seasons when the demand for their CV template services skyrockets. The existing operational framework, a hybrid of automated and manual processes, has exhibited certain limitations, notably in the manual verification phase, where a one-to-one correspondence between staff and CVs has led to inefficiencies and potential bottlenecks.

Our mission is to help the company in improving the system by making enhancement and optimization to the current system. We are seeking the best and most efficient way to overcome the challenges that faced by GetMe Hired company so that the business runs well and can grow as time goes by. In this proposal, we will provide our plans for the development of the current system in GetMe Hired company, which is not satisfactory from our perspective as a client or owner.

2.0 Overview of Project

This project aims to address these challenges by proposing enhancements and optimizations to the existing system. By delving into the database conceptual design, updating business rules, and presenting a conceptual Entity-Relationship Diagram (ERD), we intend to lay the foundation for an improved operational framework and proceeded to to implement the database logical design. Subsequently, our focus shifts to the logical design, encompassing the Logical ERD, an updated Data Dictionary, and normalization processes to enhance data integrity and reduce redundancies.

The culmination of these efforts will be the development of Relational Database Schemas after normalization, providing a structured and efficient foundation for data storage. To facilitate practical implementation, SQL Statements (Data Definition Language and Data Manipulation Language) will be presented, offering a clear roadmap for database creation and manipulation.

In summary, this project seeks to revamp and optimize Get Me Hired's existing system, addressing operational challenges and ensuring scalability for future growth. Through a comprehensive analysis and redesign of the database and associated processes, we aim to propel GetMe Hired towards a more streamlined and effective approach in connecting job seekers with prospective employers.
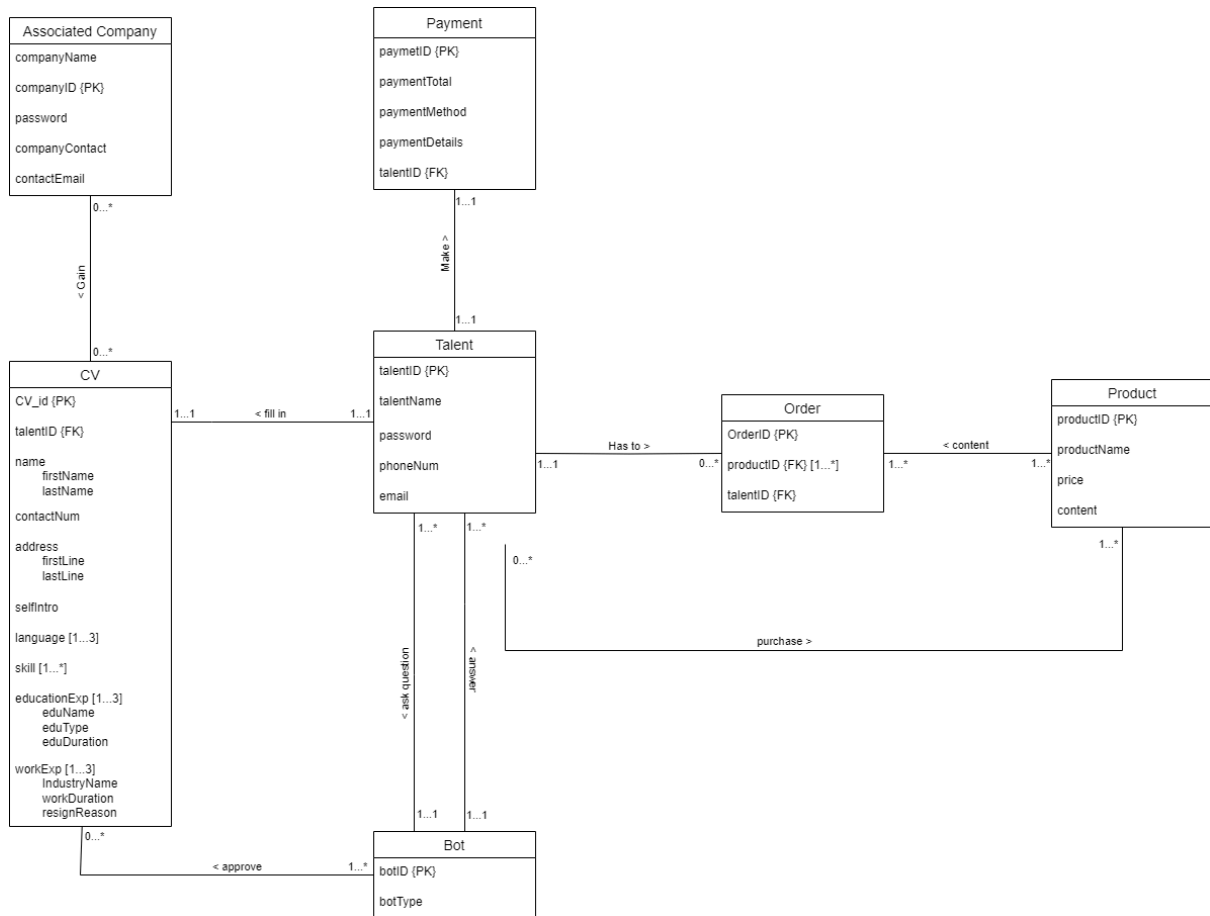

3.0 Database conceptual design
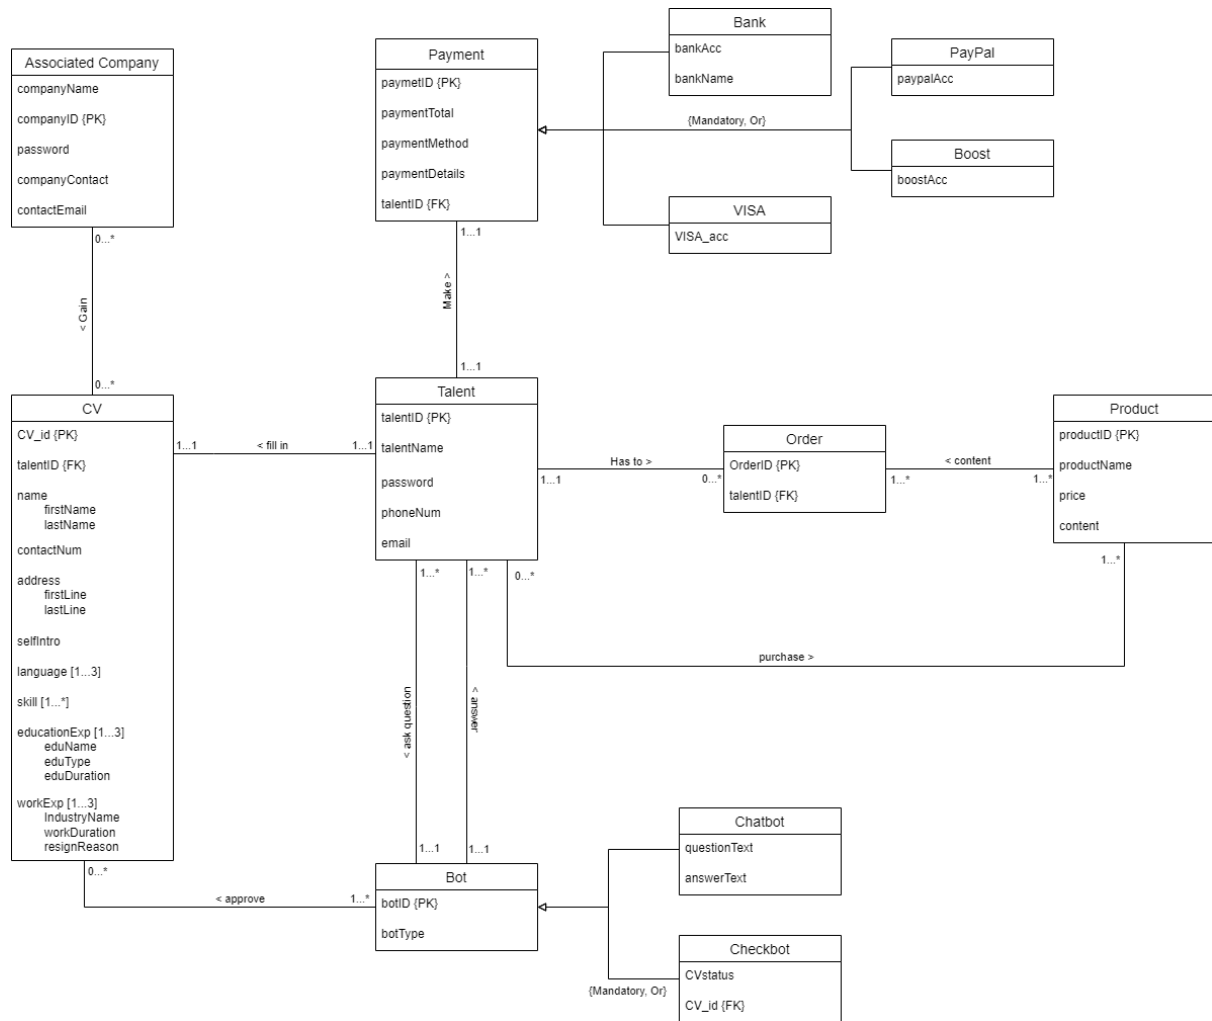

3.1 Updated business rule

1. The system is working 23 hours for 7 days.
2. Due to bank system maintenance, the payment system will be stopped for service every day from 12 am until 1 am.
3. The payment status will be updated in 5 minutes if the order is fully paid by the talent.
4. Users need to register their online platform with their real information.
5. Talents need to look at the products' content and select which one they want.
6. After selecting the products, the order will be shown to the talents.
7. Talents need to make the payment before getting the CV template.
8. Talents can select the payment method that is provided by the system.
9. Talents need to fill in the CV information with the evidence needed.
10. Talents can ask questions to the bot if they have any problem with the system.
11. The bot can be automated to check the details in the completed CV and if it is in correct status, it will approve the CV.
12. Talents need to turn on their notification so they can receive approval from the system.
13. The associated company will gain the completed CV from the system and they can select the talents based on the CV collected.
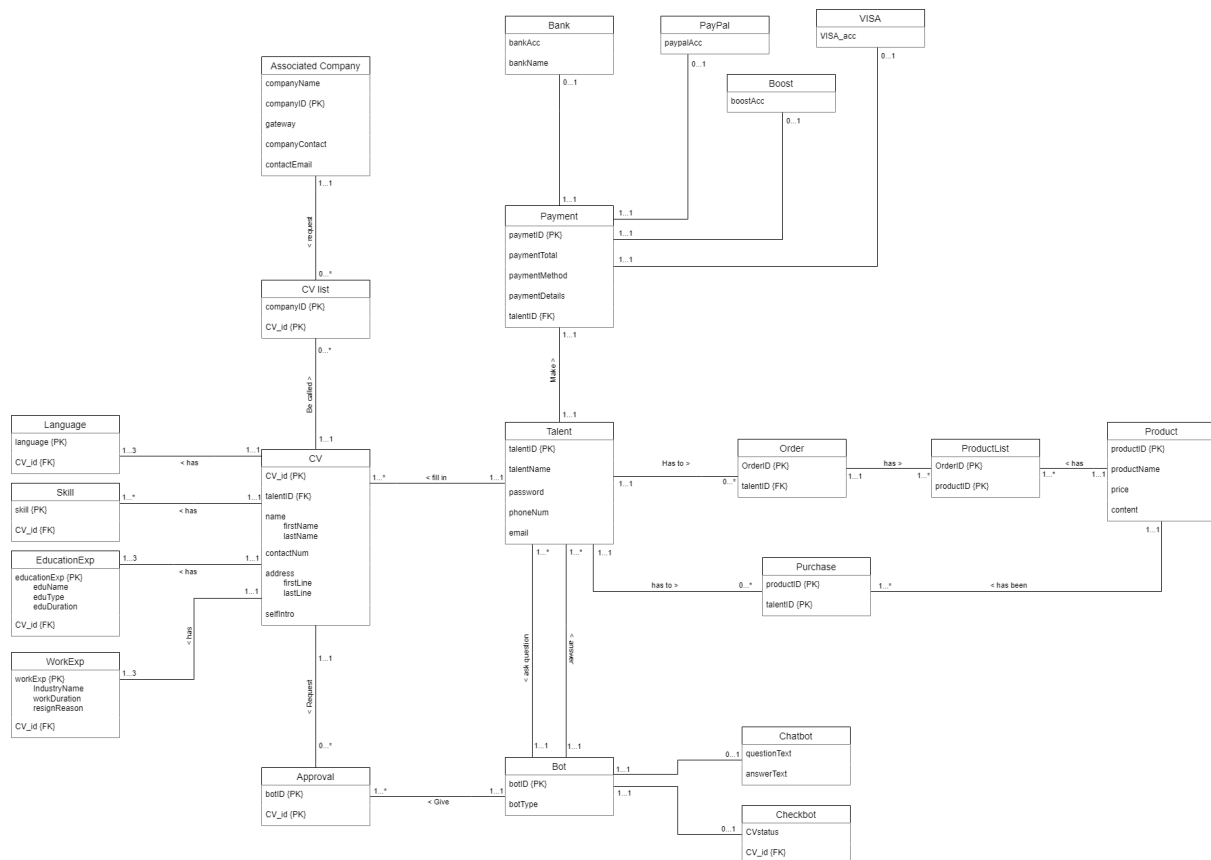

3.2 Conceptual ERD

4.0 DB logical design

4.1 Logical ERD

4.2 Updated Data Dictionary

Description of Entity

Entity	Description	Occurence
Associated company	Hold the information of associated company	● Associated company gain the CV from the GetMeHired system
CV	Hold the talent information in the CV template and the completed template	● Talent fill in the information in the CV template
Payment	Hold the payment details and method	● Each payment is made by one customer
Talent	Hold customers's	● Talent log in to the

	information	system via their account ● Talent provides personal information to the system ● Talent ask question to the system ● Talent purchase the product ● Talent make payment inside the system
Bot	Hold the AI bot of the system	● Bot will show on the page with possible questions met by users and prepared answers when users send queries or questions. ● Bot will check for the CV is perfectly done or contains any error
Chatbot	Hold the customer queries and prepared answers	● Reply the most related answer to the question based on the information inside system
Checkbot	Hold the CV status	● Check the grammar and any mistake inside the CV template
Product	Hold customer purchased product information	● Customer purchases a CV template, the product is generated in the system.
Order	Hold the order of each	● Customer order

	customer	the product in the system
OrderList	Hold the list of the order from customer	● The system will show the list of the order chosen
Purchase	Hold the information of product purchased and the talent	● Customer need to purchase the product to use in the system
Product in list	Hold the information product that sold in the system	● System will show the product can be purchased
Bank	Hold the details of customer's bank account	● Purchase the payment via bank transfer
PayPal	Hold the details of customer's PayPal account	● Purchase the payment via PayPal
Boost	Hold the details of customer's Boost account	● Purchase the payment via Boost
VISA	Hold the details of customer's Visa account	● Purchase the payment via VISA
CV list	Hold the list of CV in the system	● The completed CV will saved inside the list for associated company to look for their talent
Approval	Hold the details of CV	● Show the status of CV template is completed or error found by the bot
Language	Hold the language part in the CV template	● Show the language mastered by talent
Skill	Hold the skill part in the CV template	● Show the skills of talent
EducationExp	Hold the education	● Show the

	experience part in the CV template	education details of talent
WorkExp	Hold the work experience part in the CV template	• Show he work experience detail of talent

Entity	Multiplicity	Relationship	Multiplicity	Entity

7.0 Summary

To sum up, our team completed the important stages of the "GetMe Hired" project, which resulted in the SQL implementation and database logical design. The process of transforming the conceptual entity-relationship diagram (ERD) into a strong, logical ERD required careful consideration of functional dependencies, which were determined by reviewing and updating business rules. The creation of database relation schemas and normalization to the Third Normal Form (3NF) that followed highlights our dedication to improving data management and finding a balance between integrity and efficiency in "GetMe Hired." The system can be accessed and operated more effectively and efficiently if data redundancy is kept to a minimum.

In order to appropriately represent the modifications made throughout the normalization process, our team also gave top priority to updating the data dictionary. These days, the data dictionary is a thorough resource that provides in-depth understanding of the characteristics, entities, and connections within the system. The last stage in the process was using the Oracle SQL Developer tool to create tables using SQL statements. To put it briefly, our team is optimistic that these coordinated efforts will provide a "GetMe Hired" system that is both more efficient and easier to use, greatly improving both system efficiency and user experience overall while being inside the Third Normal Form.
